#### Note:

1. **MTBF** (mean time between failures) is a measure of how reliable a hardware product is. Its value represents the average time between a failure repair and the next failure. The unit of MTBF is typically in hours. The higher the MTBF value, the higher the reliability of the product. Please note that a lower MTBF is expected for higher capacity drives. To be conservative, the lowest MTBF is reported in this document.
2. See Section 4.2 “Power Consumption” for details.

### 6.3. Write Protection Function (Optional)

The write protect function is triggered by pin headers short. This used to set the SSD as a write protection device after power up. When the function is triggered, the data can't be written to the device. The device is then set as read only.

### 6.4. Quick Erase Function (Optional)

The Quick Erase is a special feature to allow users to erase user data in SSD by hardware trigger. the storage blocks of SSD will be erased and the SSD will return to its factory default setting. This feature is particularly useful for emergent circumstances to quickly erase user data.
